Dedicated to:

1) environmentally thoughtful mining in the 21st century

**2) *aloha 'aina*
domoni ni vanua
(love of the environment)**

**3) future generations,
to show that we managed as best we could
the environmental legacy of our minesites
and of those bequeathed to us**

TABLE OF CONTENTS

LIST OF TABLES	vi
LIST OF FIGURES	viii
PREFACE AND ACKNOWLEDGMENTS	xii
INTRODUCTION	1
1.1 Overview and Objectives	1
1.2 Organization of This Book	2
1.3 Questions	3
LAYOUT OF MINESITES AND THEIR COMPONENTS	4
2.1 Overview and Terminology	4
2.2 The Mine Component	5
2.3 Ore Stockpiles, Low-Grade-Ore Stockpiles, and Waste-Rock Dumps	16
2.4 Dams, Roads, and Building Foundations	16
2.5 Tailings Impoundments and Mills	17
2.6 Other Components	19
2.7 Questions	19
FLOW OF MINESITE DRAINAGE	21
3.1 Overview	21
3.2 Drainage Flow through and from Mines	21
3.2.1 Drainage Flow in Open-Pit Mines	23
<i>Case Study 3.2.1-1: Groundwater Depressurization in Pit Walls</i>	30
<i>Case Study 3.2.1-2: Pre-mining Rock Dewatering</i>	30
3.2.2 Underground Mines	31
<i>Case Study 3.2.2-1: Fracture Studies at an Underground Mine</i>	36
<i>Case Study 3.2.2-2: Detailed Fracture Studies at</i> <i>Underground Research Sites</i>	37
<i>Case Study 3.2.2-3: Types of Land-Surface Subsidence above</i> <i>Underground Mines</i>	40
<i>Case Study 3.2.2-4: Small-scale Flow on Fracture Planes</i>	40
<i>Case Study 3.2.2-5: Groundwater Depressurization in an Underground</i> <i>Mine Through Faults</i>	43
<i>Case Study 3.2.2-6: Techniques to Manage Flow of Groundwater in</i> <i>Underground Workings</i>	44
<i>Case Study 3.2.2-7: Finite-Element Modelling of Groundwater Flow</i>	46
<i>Case Study 3.2.2-8: Hydraulic Connections Between Land Surface</i> <i>and an Underground Mine</i>	47
3.2.3 Drainage Flow in Placer and Solution Mines	48
3.3 Drainage Flow from Stockpiles, Dumps, and Mined-Rock Piles	48
<i>Case Study 3.3-1: Small-Scale Study of Drainage Movement</i> <i>Through Mined-Rock Piles</i>	50
<i>Case Study 3.3-2: Tracking Drainage Movement through a Mined-Rock Pile</i> <i>with Thermistors and Basal Monitoring Wells</i>	50
<i>Case Study 3.3-3: Tracking Water Movement Below a Type 3 Dump</i>	52

<i>Case Study 3.3-4: A Type 2 Pile in a Dry Climate</i>	52
<i>Case Study 3.3-5: Importance of Delineating Subsurface Flowpaths Beneath Mined-Rock Piles</i>	52
<i>Case Study 3.3-6: Physical Hydrogeology of Coal Spoils (Waste Rock)</i>	57
3.4 Drainage Flow from Tailings Impoundments	58
<i>Case Study 3.4-1: Runoff from Thickened Tailings</i>	60
3.5 Questions	61
DESCRIPTION AND ASSESSMENT OF DRAINAGE CHEMISTRY	63
4.1 Overview	63
4.2 General Description	63
4.2.1 Kinetic and Equilibrium Reactions	63
4.2.2 Three Stages of Drainage Chemistry	65
4.2.3 Four Classes of Drainage Chemistry	65
4.2.4 Bacterial Contributions to Drainage Chemistry	69
4.2.5 General Trends in Minesite-Drainage Chemistry	71
4.2.6 Relationship of Drainage Chemistry to Flow and Loading	77
<i>Case Study 4.2-1: Chemical Effect of Secondary Minerals at a Reclaimed Coal Minesite</i>	79
<i>Case Study 4.2-2: Behavior of Cyanide in Minesite Drainage</i>	79
<i>Case Study 4.2-3: Drainage Chemistry at Potash Mines</i>	79
<i>Case Study 4.2-4: Effect of Freezing and Permafrost on Drainage Chemistry</i>	81
4.3 Drainage Chemistry from Mines	81
<i>Case Study 4.3-1: Chemical Effect of Groundwater Drawdown Around Mine Components</i>	81
<i>Case Study 4.3-2: Pit Backfilled with Waste Rock</i>	82
<i>Case Study 4.3-3: General Assessment of an Open Pit and Surrounding Minesite Components</i>	84
<i>Case Study 4.3-4: Series of Type 1 Pits and Other Downgradient Components at One Minesite</i>	85
<i>Case Study 4.3-5: Trends of Mine-Floor pH in an Underground Mine</i>	88
<i>Case Study 4.3-6: Natural Flooding of a Large Open Pit</i>	90
<i>Case Study 4.3-7: Assisted Flooding of a Small Open Pit</i>	90
<i>Case Study 4.3-8: Complex Seasonal Changes of Drainage through an Underground Mine</i>	92
<i>Case Study 4.3-9: Nitrogen in Drainage from Explosives</i>	97
<i>Case Study 4.3-10: An Extremely Acidic Underground Mine</i>	97
<i>Case Study 4.3-11: Natural Acidic Drainage</i>	98
<i>Case Study 4.3-12: Flooded Underground Mines (Mine Pools)</i>	98
<i>Case Study 4.3-13: Flooded Open Pit in a Wet-Dry Tropical Climate</i>	109
<i>Case Study 4.3-14: Placer Mining of an Aquifer Used for Water Supply</i>	109
4.4 Drainage Chemistry from Stockpiles, Dumps, and Mine-Rock Piles	112
<i>Case Study 4.4-1: Acidic Groundwater Drainage from an Acid-Generating Waste-Rock Dump</i>	112
<i>Case Study 4.4-2: Detailed Field Studies of Acid-Generating Waste-Rock Dumps Including Oxygen Levels and Temperature</i>	113
<i>Case Study 4.4-3: Heap Leaching of Existing Mined-Rock Piles</i>	116
<i>Case Study 4.4-4: Retention of Cyanide After Alkaline Heap Leaching</i>	116
<i>Case Study 4.4-5: Alkaline Drainage from Cement</i>	117
<i>Case Study 4.4-6: A 20-Year Perspective on Heap Leaching</i>	117

<i>Case Study 4.4-7: Physical and Chemical Characterization of an Acid-Generating Waste-Rock Dump</i>	119
<i>Case Study 4.4-8: Modelling of Mineral Reactions within a Waste-Rock Dump</i>	121
<i>Case Study 4.4-9: Onset of Net Acidity from a Waste-Rock Dump</i>	121
4.5 Drainage Chemistry from Tailings Impoundments	124
<i>Case Study 4.5-1: Groundwater Drainage from an Acid-Generating Uranium Tailings Impoundment</i>	128
<i>Case Study 4.5-2: Oxygen Entry into Sulfide-Bearing Tailings</i>	128
<i>Case Study 4.5-3: Migration and Neutralization of Acidic Groundwater Drainage from an Acidic Tailings Impoundment</i>	130
<i>Case Study 4.5-4: Detailed Hydrogeologic and Porewater Studies at a High-Sulfide Tailings Impoundment</i>	131
<i>Case Study 4.5-5: Natural Massive-Sulfide Deposits and Gossans as Natural Analogs for the Distant Future of Minesite Components</i>	133
<i>Case Study 4.5-6: Drainage Chemistry from Phosphogypsum Tailings</i>	137
4.6 Questions	138
PREDICTION OF DRAINAGE CHEMISTRY	139
5.1 Overview	139
5.2 Static Tests	139
5.2.1 Acid-Base Accounting (ABA)	139
5.2.1.1 Paste and Rinse pH	140
5.2.1.2 Sulfur Species and Acid Potentials	140
5.2.1.3 Neutralization Potentials	142
5.2.1.4 Net Potential Ratios and Net Neutralization Potentials	150
5.2.1.5 International Static Database	158
<i>Case Study 5.2.1-1: Comparison of Paste pH to Groundwater pH in an Acid-Generating Tailings Impoundment</i>	158
<i>Case Study 5.2.1-2: Study of Various NP Techniques</i>	163
<i>Case Study 5.2.1-3: Pre-mining Prediction of Acid-Generating Waste Rock and Pit Walls</i>	163
<i>Case Study 5.2.1-4: One Weighted ABA Average Per Minesite</i>	165
<i>Case Study 5.2.1-5: Net-Acid-Generating Zones in a Type 3 Waste-Rock Pile, and Accumulation of Acidity along Basal Flowpaths</i>	166
<i>Case Study 5.2.1-6: Pre-Mining Block Modelling of ABA Data</i>	168
<i>Case Study 5.2.1-7: An Inappropriate ABA Analytical Standard</i>	170
<i>Case Study 5.2.1-8: Errors in Predictions Using Static Tests</i>	174
5.2.2 Mineralogy	174
5.2.3 Total-Metal and Whole-Rock Analysis	175
5.2.4 Retention of Reaction Products	176
5.2.5 Grain-Size Analysis and Particle-Surface Area	177
<i>Case Study 5.2.5-1: Grain Size, Surface Area, and Reaction Rates</i>	177
5.2.6 NAG Test	178
5.3 Laboratory-Based Kinetic Tests	179
5.3.1 Humidity Cells	180
<i>Case Study 5.3.1-1: Small-Scale Kinetic Testing</i>	182
<i>Case Study 5.3.1-2: Effects of Changing Air Flow and Rinse-Water</i>	

	<i>Volume on Humidity Cells</i>	190
	<i>Case Study 5.3.1-3: Net Acid Generation in Slow Oxidizing, Non-Carbonate Tailings</i>	191
5.3.2	Columns	192
	<i>Case Study 5.3.2-1: Five-Year-Duration Column Testing on Acid-Generating Waste Rock</i>	192
	<i>Case Study 5.3.2-2: Comparison of ABA Data to Kinetic-Test Results</i>	194
	<i>Case Study 5.3.2-3: Five-Year Kinetic Studies of Acid-Generating Rock with Added Limestone</i>	195
5.3.3	International Kinetic Database	198
5.4	Field Kinetic Tests	204
5.4.1	Bins or Cribs	204
	<i>Case Study 5.4.1-1: Field Monitoring of Eleven 400-t Waste-Rock Piles</i>	204
	<i>Case Study 5.4.1-2: Fourteen-Year Monitoring of 1000-t Ore Piles</i>	206
5.4.2	Minewall Stations	208
5.4.3	Routine Site Monitoring	212
5.5	Adjustments of Static and Kinetic Tests for Full-Scale Minesite Components	214
5.5.1	Portions of Components Exposed to Air and Water	215
5.5.2	Portions of Components Exposed to Water Only	219
5.6	Questions	222
CONTROL OF DRAINAGE CHEMISTRY		224
6.1	Reactive Control of Drainage Chemistry	224
6.1.1	Active Collection and Treatment	224
	<i>Case Study 6.1.1-1: Relative Costs of Treatment and Control for Acidic Drainage</i>	227
	<i>Case Study 6.1.1-2: Loss of Injected Alkaline Process Water at a Solution Mine</i>	227
	<i>Case Study 6.1.1-3: Reactive Control of Potash-Tailings Drainage</i>	229
	<i>Case Study 6.1.1-4: Remediation Studies at a One-Hundred-Year-Old Minesite</i>	230
6.1.2	Passive Collection and Treatment	231
	<i>Case Study 6.1.2-1: Passive Treatment of Ponded Acidic and Metal-Laden Drainage with Scrap-Metal Electrodes</i>	231
	<i>Case Study 6.1.2-2: Passive Treatment of Acidic and Metal-Laden Drainage with Wetlands</i>	232
	<i>Case Study 6.1.2-3: Passive Treatment of Acidic Drainage by Bacteria</i>	232
	<i>Case Study 6.1.2-4: Anoxic Limestone Drains</i>	232
6.2	Solid Covers	235
	<i>Case Study 6.2-1: Covers and Other Techniques for Control of Cyanide and Acidic Drainage in a Tropical Climate</i>	235
	<i>Case Study 6.2-2: Integrated Control of Waste-Rock Drainage and Acidic Pit Water</i>	237
	<i>Case Study 6.2-3: Solid Covers on Waste Rock and Tailings</i>	241
	<i>Case Study 6.2-4: Cement Covers and Seals</i>	242
	<i>Case Study 6.2-5: Comparative Testing of Various Solid and Water Covers and Chemical Additions</i>	242
	<i>Case Study 6.2-6: Multilayer Solid Covers</i>	243
	<i>Case Study 6.2-7: Predicted Oxygen Flux through a Non-Reactive Cover</i>	244

<i>Case Study 6.2-8: Thickened Tailings</i>	245
<i>Case Study 6.2-9: Reactive Treatment and Subsequent Effect of a Proactive Soil Cover over Acidic Waste Rock</i>	245
6.3 Water Covers	246
<i>Case Study 6.3-1: Marine Disposal of Tailings and Waste Rock with Soluble Heavy Metals</i>	247
<i>Case Study 6.3-2: Reaction Rates of Submerged Rock and Tailings</i>	248
<i>Case Study 6.3-3: Flooding of Previously Acidic Tailings</i>	250
6.4 Other Techniques	252
<i>Case Study 6.4-1: Backfill of Tailings</i>	252
<i>Case Study 6.4-2: Pervious Surround</i>	253
<i>Case Study 6.4-3: Placement of Tailings into a Pit</i>	255
<i>Case Study 6.4-4: Effect of "Wet" Mine Seals on Drainage Chemistry</i>	256
<i>Case Study 6.4-5: Layering of Mined Rock to Control Drainage Chemistry</i>	257
6.5 Questions	259

LIST OF TABLES

2.1-1. Examples of Minesite Components Potentially Affecting Drainage Chemistry	5
3.2.1-1. Case Studies of Groundwater Flow to Pits	26
3.2.2-1. Methods for Underground Water Control	45-46
4.2.1-1. Kinetic vs. Equilibrium Reactions	64
4.2.1-2. Examples of Sulfide Minerals	64
4.2.2-1. Examples of Secondary Minerals	67-68
4.2.3-1. Four Classes of Minesite Drainage Based on pH Effects of Primary Minerals	69
4.2.5-1. Annual Statistics for Drainage Chemistry at a Monitoring Station Receiving Drainages from Several Waste-Rock Dumps and an Open Pit	72
4.2.5-2. Example of an Empirical Drainage-Chemistry Model Including an Open Pit, Several Waste-Rock Dumps, and a Tailings Impoundment	76
4.2.5-3. Probability Levels and Corresponding Time Intervals within a Year	77
4.2.5-4. Example of Cyanide Degradation in Tailings Drainage, Golden Cross Project, New Zealand	80
4.3-1. Water Chemistry in the Flooding Berkeley Pit	91
4.3-2. Chemical Analyses of Bottom and Suspended Sediment in D Pit	93
4.3-3. Examples of Drainage Chemistry from Underground Workings at Iron Mountain	99-100
4.3-4. Range of Drainage Chemistry from Portals at Iron Mountain	100
4.3-5. Vertical pH Profiles in Flooded Underground Shafts	101-102
4.3-6. Temporal Trends in Mine-Pool Chemistry at Three Sites	104
4.3-7. Vertical Trends in Water Chemistry in the Dober Mine Complex	105
4.3-8. Median Water Chemistry in Drainage and Monitor Wells in a Partially Flooded Underground Coal Mine	108
4.3-9. Water Chemistry in Flooded Pits and Surrounding Groundwater Systems, Northern Territory, Australia	110
4.4-1. Dissolved Concentrations in Groundwater Beneath Acid-Generating Waste Rock at a Uranium Minesite	113
4.4-2. Measurements of Thermal Conductivity, Air Permeability, and Oxygen Diffusion Coefficients in Waste-Rock Dumps	114
4.4-3. Calculated Large-scale Oxidation Rates in Waste-Rock Dumps	114
4.4-4. Waste-Rock Drainage Chemistry in Ditches, Aitik Minesite	122
4.4-5. Mineralogy of Fresh Waste Rock at the Aitik Minesite	122
4.5-1. Sources and Rates of Metal Release from a Tailings Impoundment	125
4.5-2. Concentrations in an Acidic Tailings Pond at a Uranium Mine	130
4.5-3. Attenuation of Acidic Drainage from a Tailings Impoundment Along a Groundwater Flowpath	132
4.5-4. Zones and Mineralogy of Gossan and Supergene Zones of Massive-Sulfide Deposits of the Bathurst Area, New Brunswick, Canada	136
4.5-5. Enrichment or Depletion in Oxidized Massive-Sulfide Deposits of the Bathurst Area of Canada	137
5.2.1-1. Relative Reaction Rates of Minerals Contributing to Acid Neutralization	148
5.2.1-2. Factors for Converting Amounts of Selected Aluminosilicate Minerals to NP Values	148
5.2.1-3. Universal ABA Criteria for Assessing or Predicting pH Range of Minesite Drainage	152
5.2.1-4. Comparison of Five NP Techniques for Acid-Base Accounting	164
5.2.1-5. ABA Results for the Gibraltar North Project, Canada	165
5.2.1-6. Vertical Trends in ABA Parameters in Boreholes, Myra Falls Operations	167
5.2.1-7. Summary Statistics in ABA Parameters in Boreholes, Myra Falls Operations	168

5.2.1-8. Summary Parameters for Windy Craggy Semivariograms	170
5.2.2-1. Example of Reactive-Mineral Composition of Tailings	176
5.3.1-1. Effect of Grain Size on Reactive Surface Area	182
5.3.2-1. Pre-test Analysis of Grain Sizes of Woodlawn Waste Rock	193
5.3.2-2. Metal Concentrations and Release Rates from Woodlawn Waste Rock	194
5.3.2-3. Five-Year Column Tests of Limestone Mixed With Net-Acid-Generating Rock	196
5.3.2-4. Results of Mixed Limestone-Rock Columns	197
5.3.2-5. Five-Year On-Site Piles of Net-Acid-Generating Rock	199
5.4.1-1. Composition of Eleven 400-t Waste-Rock Piles Monitored for One Year	205
5.4.1-2. Description of Field Test Piles for Duluth Complex Rock	207
5.4.1-3. Values of Effective Neutralization Potential in Duluth Complex Test Piles	207
5.4.2-1. Average Minewall Production Rates (mg/m ² /wk) from an Underground Mine	210
5.4.2-2. Average Minewall Production Rates (mg/m ² /wk) from a Pit	211
5.4.2-3. Adjusted Rates of Acid Leaching and Flow Dependencies in an Underground Mines	213
5.4.2-4. Partial Input Data for the Simulation of the Main Zone Pit at Equity Silver Mines	213
5.5.1-1. General Extent of Air Exposure for Typical Minesite Components	217
5.5.1-2. Examples of Values and Equations for Effective Diffusion Coefficients for Gaseous Oxygen Within Mine-Component Materials	218
5.5.2-1. Saturation Concentrations of Dissolved Oxygen in Water Based on Temperature and Percentage of Oxygen in the Adjacent Gas Phase	221
6.1.1-1. Cost Comparison of Five Proactive Prevention Techniques Against Collection and Treatment for Acidic Drainage	228
6.1.1-2. Cost Comparison of Reactive and Proactive Control Techniques for Acidic Drainage from Waste Rock and Tailings	228
6.1.2-1. Examples of Wetland-Treated Drainage in a Temperate Climate	233
6.1.2-2. Examples of Twenty-One Anoxic Limestone Drains	234
6.2-1. Metal-Release Rates from Various Minesite Components during the 1973-1974 Wet Season at the Rum Jungle Minesite	238
6.2-2. Loadings in the East Finniss River Downstream of the Rum Jungle Minesite	239
6.2-3. Water Balance for Dumps at the Rum Jungle Minesite	240
6.2-4. Small-Scale Efficiencies of Techniques for Minimizing Acid Generation	243
6.2-5. Trend in Drainage Chemistry from a Waste-Rock Dump with Multilayer Cover	244
6.3-1. Metal Release Rates from Marine Tailings Disposal, Black Angel Mine, Greenland	248
6.3-2. Laboratory Columns for Submergence of Acid-Generating Tailings	251
6.4-1. Examples of Tailings Retrieval from Surface Impoundments	254
6.4-2. Drainage Chemistry Behind Wet Portal Seals in West Virginia, USA	258-259
B-1. Volumes and Normalities of Acid Addition for NP Determination on Fizz Rating	315
C-1. Recommended Equations for Interpreting Laboratory Kinetic Tests	328-330

LIST OF FIGURES

2.1-1. Schematic Diagram of a Minesite	6
2.2-1. Schematic Open-Pit Mining - Type 1	8
2.2-2. Schematic Open-Pit Mining - Type 2	9
2.2-3. Schematic Open-Pit Mining - Type 3	10
2.2-4. Photographs of Various Types of Open Pits	11
2.2-5. Schematic Underground Mining - Type 1	12
2.2-6. Schematic Underground Mining - Type 2	13
2.2-7. Photographs of Various Types of Underground Mines	14
2.2-8. Schematic Placer and Solution Mining	15
2.5-1. Photographs of Tailings Impoundments	18
2.5-2. Typical Process and Terminology for Coal Milling	19
3.2-1. Computer-Based Example of Fractured Rock and Groundwater Flow	23
3.2.1-1. Schematic Water Movement In and Near Open-Pit Mines During Operation	24
3.2.1-2. Schematic Pit Filling by Natural Processes During Closure	27
3.2.1-3. Schematic Pit Filling by Assisted Methods During Closure	28
3.2.1-4. Schematic Pit Filled to its Static Level	29
3.2.2-1. Schematic Underground Mines Free Draining to Surface or Shaft	32
3.2.2-2. Schematic Underground Mines during Closure with No Portal Plugging	33
3.2.2-3. Schematic Underground Mines during Closure with Fully Plugged Portals	34
3.2.2-4. Formation of a Pressure Arch during Underground Mining	35
3.2.2-5. Rock Collapse and Tension Zones during Subsidence	35
3.2.2-6. Example of Kinematic, Diffusion, and Residual Porosities	36
3.2.2-7. Fracture Patterns in Closely Spaced Boreholes at the Stripa Project	37
3.2.2-8. Changes in Water Pressure within Selected Fractures at the Stripa Project	38
3.2.2-9. Predicted and Measured Head Losses during Mining through a Fracture Plane at URL	39
3.2.2-10. Discrete Fracture Permeabilities at URL	41
3.2.2-11. Fracture Permeabilities at Colorado School of Mines' Experimental Mine	42
3.2.2-12. Piezometric Drawdowns after Excavation of the Pan Adit	43
3.2.2-13. Drawdown As Adit Excavation Approaches Piezometer	44
3.2.2-14. Piezometric Drawdowns after Excavation of the Western Adit	44
3.3-1. Mined-Rock Pile - Type 1: (a) schematic, (b) photograph	49
3.3-2. Mined-Rock Pile - Type 2: (a) schematic, (b) photograph	49
3.3-3. Mined-Rock Pile - Type 3: (a) schematic, (b) photograph	49
3.3-4. Conceptual Model of Channelized Drainage Flow through a Mined-Rock Pile	51
3.3-5. Channelling in Small-Scale Rock Piles	51
3.3-6. Layout of Myra Falls Operations and Dump #1	53
3.3-7. Internal Temperatures in Dump #1 Through 1991	54
3.3-8. Response of Internal Temperatures and Basal Water Table in Dump #1	55
3.3-9. Cross-section through the Coedely Spoil Pile, Great Britain	56
3.3-10. Cross-section through the Diplomat Mine Coal Spoils Pile in a Backfilled Pit	56
3.3-11. Cross-section through the Mt. Washington Minesite	57
3.3-12. Schematic Cross-section of a Coal Waste-Rock Dump	58
3.4-1. Examples of Tailings Grain Sizes from Metal Mines	59
3.4-2. Particle-Size Segregation in a Tailings Impoundment	59
3.4-3. Hydraulic-Conductivity Pattern in Thickened Tailings	60
3.4-4. Depth to Water Table in a Tailings Impoundment	60

3.4-5. Vertical Cross-section Showing Groundwater Movement through a Tailings Impoundment	60
4.2.1-1. Evolution of Kinetic to Equilibrium Conditions	63
4.2.2-1. Three Stages of Minesite-Drainage Chemistry	66
4.2.4-1. Example of Short-Term Effects from Inoculating Humidity Cells with <i>Thiobacillus ferrooxidans</i>	70
4.2.5-1. Examples of Empirical Drainage-Chemistry Correlations with pH	73
4.2.5-2. Examples of Copper vs. pH Correlations at Three Minesites	74
4.2.5-3. Simulations of Less-Frequent Sampling with a Database of Samples Collected Every Four Hours (adapted from Morin et al., 1993)	78
4.2.6-1. Scatterplots of Flow against Copper and Zinc	78
4.3-1. Plan and Cross-section of the Solbec Pit	83
4.3-2. Map, Groundwater Flow, and Acidic Zone at Brunswick No. 6 Minesite	86
4.3-3. Map of the Midnite Minesite	87
4.3-4. Simplified Vertical Cross-section through Part of the Bunker Hill Mine with Mine-Floor pH Measurements	89
4.3-5. Monitoring of Flow and Chemistry on Level 8, Myra Falls Operations	94
4.3-6. Flow and pH at Portal, Flow at Stope Y, and Daily Precipitation, Myra Falls Operations	95
4.3-7. Schematic Flow through Time on Level 8, Myra Falls Operations.	96
4.3-8. Cross-section through Iron Mountain	97
4.3-9. Vertical Profiles of Specific Conductance in Flooded Mine Shafts	103
4.3-10. Vertical Profiles of Water Chemistry in a Flooded Shaft	103
4.3-11. Layout of the Dober Mine Complex	104
4.3-12. Vertical Cross-section through the Keystone Park Underground Coal Mines	105
4.3-13. Plan View of the Keystone Park Underground Coal Mine	106
4.3-14. Temporal Trends of Acidity and Flow in Drainage from the Keystone Park Underground Coal Mine	106
4.3-15. Temporal Trend of Sodium in Drainage from the Keystone Park Underground Coal Mine Following Alkaline Injection at Two Wells	107
4.3-16. Temporal Trends of Acidity, Sulfate, and Flow in Drainage from the Friendship Hill Underground Coal Mine	109
4.3-17. Viney Creek Placer Minesite and Nearby Water-Supply Wellfield and National Park	109
4.3-18. Temporal Trends in Groundwater Iron Concentrations Before and After Placer Mining at Viney Creek Minesite	111
4.4-1. Vertical Cross-section through Acidic Groundwater Drainage from a Uranium-Mining Waste-Rock Dump	112
4.4-2. Depth Profiles of Poregas in White's (A, B, D) and Intermediate (X, Y, Z) Dumps at the Rum Jungle Minesite	115
4.4-3. Profiles of Oxygen Levels in the Aitik Dump Through Time	115
4.4-4. Observed and Calculated Copper Leaching from the 12-m high Midas Test Dump	118
4.4-5. Acidity Concentrations in Dump Drainage at Mine Doyon	120
4.4-6. Temporal Trends of pH and Sulfate at Station NDD	123
4.4-7. Temporal Trends of pH and Sulfate at Station EDD	124
4.5-1. Sub-Region Neutralization of Acidic Drainage Along Flowpaths.	126
4.5-2. Groundwater Seepage from a Uranium Tailings Impoundment, Wyoming, USA	129
4.5-3. Migration and Progressive Neutralization of Acidic Groundwater Drainage from an Acidic Tailings Impoundment	131
4.5-4. Plan Map and Vertical Cross-section through the East Sullivan Tailings Impoundment	133

4.5-6. Vertical Profiles of Pore Gases and Porewater Concentrations in the East Sullivan Tailings	134
5.2.1-1. Examples of ABA Total Sulfur vs. Sulfide	143
5.2.1-2. Examples of ABA Total Sulfur/Sulfide vs. Paste pH	144
5.2.1-3. Examples of ABA Total Sulfur vs. Sulfate	145
5.2.1-4. Examples of ABA Paste pH vs. Sulfate	146
5.2.1-5. Examples of ABA Neutralization Potential (NP) vs. Paste pH	149
5.2.1-6. Examples of ABA Bulk NP vs. Carbonate NP (CaNP)	151
5.2.1-7. Examples of ABA xNPR vs. Total Sulfur and NP	153
5.2.1-8. Examples of ABA xNNP vs. NP and Sulfur	154
5.2.1-9. Examples of ABA xNPR vs. Paste pH	155
5.2.1-10. Examples of ABA xNNP vs. Paste pH	156
5.2.1-11. Examples of ABA xNPR vs. xNNP	157
5.2.1-12. Lognormal Distribution of Total Sulfur across an Entire Mine	158
5.2.1-13. Variability of ABA Parameters Within and Across Strata: (a) Sedimentary Terrain, (b) Volcanic Terrain	159-160
5.2.1-14. Paste pH vs. Neutralization Potential from the International Static Database	161
5.2.1-15. Solid-Phase Paste pH in a Cross-section of the Nordic Main Tailings Impoundment	162
5.2.1-16. Groundwater Aqueous pH in a Cross-section of the Nordic Main Tailings Impoundment	162
5.2.1-17. Minesite Averages of NNP vs. Hectares Per Hole at Each Minesite	166
5.2.1-18. Minesite Averages of Net Alkalinity vs. Minesite-Average NP	166
5.2.1-19. ABA Profile along Borehole 25, Myra Falls Operations	166
5.2.1-20. ABA Profile along Borehole 15, Myra Falls Operations	167
5.2.1-21. Aqueous pH along Basal Flowpath in Dump	167
5.2.1-22. Correlation of NP to Calcium in the Windy Craggy Database	168
5.2.1-23. Kriging Semivariogram for Argillite at Windy Craggy	169
5.2.1-24. Geostatistical Block Modelling of NPR at Las Cristinas	171
5.2.1-25. Kriging Variograms for All Rock Units and Sulfide Saprolite Only	172
5.2.1-26. Total-Sulfur Analyses for a Standardized ABA Sample by Several Laboratories	173
5.2.1-27. NP Analyses for a Standardized ABA Sample by Several Laboratories	173
5.2.1-28. Comparison of 34 NP Analyses at Two Laboratories	173
5.2.6-1. Comparison of Times to Acidification in Columns to Times for pH Depression in NAG Tests	179
5.3.1-1. Examples of Aqueous pH and Rates of Sulfate Production and Acid Neutralization in Humidity Cells Remaining Near Neutral pH	183
5.3.1-2. Examples of Leaching Rates of Copper and Zinc in Humidity Cells Remaining Near Neutral pH	184
5.3.1-3. Examples of Aqueous pH and Rates of Sulfate Production and Acid Neutralization in Humidity Cells Becoming Acidic	185
5.3.1-4. Examples of Leaching Rates of Copper and Zinc in Humidity Cells Becoming Acidic	186
5.3.1-5. Examples of Aqueous pH and Rates of Sulfate Production and Acid Neutralization in Humidity Cells Remaining Acidic	187
5.3.1-6. Examples of Leaching Rates of Copper and Zinc in Humidity Cells Remaining Acidic	188
5.3.1-7. Examples of Aqueous pH and Rates of Sulfate Production and Acid Neutralization in Humidity Cells Remaining Alkaline	189
5.3.1-8. Examples of Leaching Rates of Copper and Zinc in Humidity Cells Remaining Alkaline	189

5.3.1-9. Trends in Drainage Chemistry and Remaining Calcite from Small-Scale Kinetic Tests	190
5.3.1-10. Sulfate Release Rate vs. Original Sulfide Content from Small-Scale Kinetic Tests	191
5.3.2-1. Poregas Composition of Woodlawn Waste Rock in Leach Column	193
5.3.2-2. Temporal Trends of Effluent Chemistry from Cinola Columns	195
5.3.2-3. Correlations of Geochemical Events with NP from Cinola Columns	197
5.3.3-1. Examples of Two-Dimensional Plots of IKD Data	200
5.3.3-2. Carbonate Molar Ratio vs. Initial Sulfur and Initial NP in the IKD	201
5.3.3-3. Copper Leaching Rate vs. Initial Sulfur and Initial Copper Content in the IKD	202
5.3.3-4. Zinc Leaching Rate vs. Initial Sulfur and Initial Zinc Content in the IKD	203
5.4.1-1. Annual Median Drainage pH for In-Field 1000-t Test Piles	206
5.4.2-1. Best-Fit Simulation of pH in the Main Zone Pit During Operation and Decommissioning	214
5.5.1-1. Conceptual Column for Calculating Oxygen Diffusion and Depth of Oxidation	217
5.5.2-1. Conceptual Submerged Column for Calculating Oxygen Diffusion	220
6-1. Example of Designing Drainage-Chemistry Control with a Clay Cover	225
6-2. Example of Designing Drainage-Chemistry Control with Inert-Soil and Water Covers	225
6.1.1-1. Plan View of Subsurface Migration of Potash-Tailings Brine	230
6.2-1. Cyanide Balance from the Mill to the Kelian River at Kelian Equatorial Mining	236
6.2-2. Schematic Map of the Rum Jungle Minesite	238
6.2-3. Temporal Trends in Oxygen and Temperature below a Multilayer Cover	244
6.2-4. Temporal Trends in Loadings of Acidity, Zinc, and Copper to the Equity Silver Treatment System	246
6.2-5. Temporal Trends in Lime Consumption in the Equity Silver Treatment System	246
6.3-1. Effluent pH from Waste-Rock Columns with and without Water Covers	249
6.3-2. Schematic Flooding of Acid-Generating Quirke Tailings	252
6.4-1. Relationship of Drainage pH to Aqueous Concentrations of Acidity, Iron, and Manganese from Wet Portal Seals	257
C-1. Humidity Cell for Rock	321
C-2. Humidity Cell for Tailings	322
C-3. Pre-Test Sample Description for Kinetic-Test Samples	323
C-4. Weekly Report Form for Kinetic Testing	324
D-1. Example of a Minewall Station	333

PREFACE AND ACKNOWLEDGEMENTS

This book has three purposes. First, it is a *guidebook* for the assessment, prediction, and control of minesite-drainage chemistry. The chapters on these tasks emphasize practical, rather than theoretical, concepts. As demonstrated here, the abundant conflicting theories on drainage chemistry are, for the most part, unimportant to the practical requirements of many minesites.

Second, this is a *reference book* containing numerous case studies on various aspects of drainage chemistry. These illustrate the many different views of drainage-chemistry work around the world and are valuable in extrapolating conclusions to other minesites. Case studies are used heavily in this book to illustrate common themes and to highlight atypical findings.

Third, this is a *textbook* to present the state-of-the-art in minesite drainage to fellow students on the topic. The questions at the end of each chapter provoke additional thought and insight into important issues. No matter what level of experience and age, there is something new and informative in this book for every reader.

Based on our work with more than 130 proposed and existing minesites, and on reviews of hundreds of papers and reports by many others, these three ambitious purposes have been attained here in a reasonably compact book. We welcome copies of other papers and reports that readers consider important and valuable to future compilations.

We have noticed there is confusion sometimes between minesite-drainage chemistry and water-quality impacts. The emphasis in this book is on the chemistry of waters draining from various minesite components. In the jargon of hydrologic studies, the focus is on “headwater” chemical effects in and around a minesite. There is little emphasis on “downstream” chemistry in distant rivers and lakes, where regional water-quality and biological impacts are defined by applicable legislation and social expectations. Consistent with this view, “water quality”, which implies comparison to some standard, is rarely used here.

A book like this on theory and case studies cannot be created in isolation from other people — no one person could carry out all these studies and interpretations. Therefore, there are many people and publications that we have depended on, and learned from. Obviously, the efforts of all authors listed in the References are important and gratefully recognized. We are especially grateful to the people who provided technical and editorial comments on various chapters of this book:

Les MacPhie, Geocon/SNC—Lavalin Environment [Chapters 1 to 6]

Peri Mehling, Mehling Environmental Management [Chapters 1 and 2]

Gavin Murray, Placer Pacific Limited [Chapters 1 to 6]

Jim Robertson, Placer Dome Inc. [Chapters 3 to 6]

We also acknowledge the time and efforts of those that we have worked with professionally and personally, who are employed by mining companies, regulatory agencies, universities, consulting firms, and laboratories. With mining companies, we offer particular thanks to Jim Robertson (Placer Dome Inc.), Keith Ferguson (Placer Dome Canada), Gavin Murray (Placer Pacific Limited), Vern Coffin (Noranda Mining and Exploration), Ross Gallinger (Rio Algom Limited), Ian Horne (formerly with BHP Minerals Canada), Derek Riehm (Teck Corporation), Luc St-Arnaud (Noranda Technology Centre), and Kelvin Dushnisky (Redfern Resources Ltd.)

To those with regulatory agencies, we have particularly benefited from discussions with Bill Price (British Columbia Ministry of Employment and Investment, Energy and Minerals Division), Grant Feasby, Gilles Tremblay, and Carl Weatherell (MEND/Natural Resources Canada), and Kim Lapakko (Minnesota Department

of Natural Resources).

The university professors we wish especially to thank are John Cherry and David Blowes (University of Waterloo) and Ernest Yanful (University of Western Ontario).

We have benefited greatly from discussions with fellow consultants, particularly Les MacPhie and Maciej Szymanski (Geocon/SNC-Lavalin Environment), Clem Pelletier (Rescan Environmental Services), Ron Nicholson (Beak Consultants), and Shirley Hutt (Ocean Bound Enterprises).

On a personal level, Kevin thanks Catherine, Karla, Kathy, Larry, Karen, Joe, Keith, Robin, Kirk, David, Jennifer, Christina, Laura, Kyle, Drew, Amanda, and the rest of the gang. Nora thanks Shirley, George, and Noreen.

CHAPTER 1 INTRODUCTION

1.1 Overview and Objectives

Mining and milling (concentrating) of ore has always been a fundamental activity of the human race, supplying the metals, nonmetals, and minerals needed to maintain and advance our standard of living. Therefore, it is no coincidence that mining activity has grown in intensity and complexity as human civilization has grown and expanded. A simple testimony to this symbiotic relationship is human epochs like the Iron and Bronze Ages. Other testimony comes from historical reports of mining.

Documented mining for raw materials reaches back to the Stone Age, with a 20,000-year-old underground flint mine reported in a limestone cave in Australia (James and Thorpe, 1994). Due to the demand for flint axes, several flint mines were operating in Western Europe by 4000 B.C., with hundreds of shafts dug to depths of 9-12 m.

Copper mining was underway at Rudna Glava, Serbia, by 4500 B.C. to depths of 60 feet (James and Thorpe, 1994). By 2600 B.C., Egyptians were mining turquoise and copper in the Negev of northern Sinai with 6-meter-diameter shafts accompanied by a system of underground workings. About the same time, rock with silver and lead was being mined near Athens using underground workings driven up to 330 feet laterally into hillsides. Cisterns for water supply and ore washing (milling) were excavated nearby into rock and lined with cement.

Underground coal mines in China are reported as early as 200 BC while Roman coal mines in Britain are reported around 100 A.D. (James and Thorpe, 1994). Ancient Romans also operated mines for iron, gold, silver, tin, copper, and lead (Thornton, 1996). These included a copper mine at Córdoba, Spain, with a 688-foot-deep shaft and a lead-silver mine at El Centenillo with workings 3500 feet long and 650 feet deep (James and Thorpe, 1994). The Romans apparently developed relatively advanced techniques for excavating, lighting, ventilating, and

draining mines, such as a vertically staged series of 15-foot-diameter water wheels.

Due to our relatively short lifespan, it can be easy for people to overlook past lessons and advances. Today, many think of past mining and milling activities, even a hundred years ago, as primitive. However, by the time Agricola (1556) wrote his text on mining and milling centuries ago, these activities were already refined sciences and arts. The refinements continue today and will no doubt continue into the future.

One rapidly growing refinement is the incorporation of environmental maintenance into the economics and engineering of mining. This is a reasonable consequence of increasing environmental awareness and the increasing intensity and cumulative extent of mining. Some statistics illustrate this best. By the Year 2000, Merrington and Alloway (1994) expect that approximately 240,000 km² of the earth's surface will have been disturbed by mining activity. In the Canadian Province of Ontario, there are more than 6000 abandoned minesites with varying degrees of environmental, safety, and health concerns (Mitchell and Mackasey, 1995). In the USA, 17,000 abandoned mines are documented in the State of Utah alone (Vance et al., 1995). Also in the USA, aquatic life has been decimated in 4100 km of 88,000 km of streams within the Commonwealth of Pennsylvania by acidic mine drainage (Scheetz et al., 1995). The Chinese mining industry generates an estimated 2.5×10^9 m³/yr of polluted water (Chen and Huang, 1995) and Chinese coal mining alone generates 150×10^6 t of waste a year (Hu, 1995). This intense industrial activity around the world must be accompanied by environmental protection or restoration.

In the past, mining and milling were sometimes considered sufficiently important to dismiss legally corporate responsibility for adverse effects on the local environment and health (Vranesh, 1979). It is interesting to read Weingart (1982), an ex-hardline miner, publicly confessing his "sins" and accepting

environmental responsibility. There is no longer any doubt that many mining companies place major emphasis on environmental protection. For example, Robertson (1994a) reports that his company will not mine sulfide-bearing ore if the subsequent acid generation cannot be properly prevented or controlled.

Blight (1979) summarized the mining-environment issue well:

“It is well to concede at this point that any mining or industrial activity will inevitably cause some environmental damage. The overall benefit to the country must be offset against this damage. It must also be recognized that whatever control measures are instituted, due regard must be paid to local conditions and current circumstances. The costs of the waste disposal operation in relation to the revenue-producing operation that must pay for it, the practicability of the environmental protection measures proposed, and the short and long-term consequences of these measures, both for the safety of the public and for their quality of life, must all receive careful and due consideration.” This is reflected in the current international movement for sustainable development.

There are some who oppose efforts to return the environment at old minesites as close as possible to pre-mining conditions. For example, an international organization suggests that millions of bats have been lost by closing and sealing underground mines (Taylor, 1995). Also, Banks et al. (1996) argue that minesite drainages with elevated concentrations of some metals and lower concentrations of others have historically played a beneficial roles. They have provided or augmented surface-water base flows, drinking-water supplies, water treatment, spa waters, and secondary minerals for paints and industrial processes. Nevertheless, this opposition to restoration represents a minority today.

Mining operations can have physical, chemical, and biological effects on the local environment, which consists of soil and rock (solid phase), groundwater and surface waters (liquid phase), and air and pore gases (gaseous phase). Any detailed discussion of one effect or one phase alone can fill,

and has filled, several proceedings and books. In this book, the focus is primarily on the chemistry of surface and ground waters draining from minesite components.

In the fields of environmental geochemistry and environmental hydrogeology, sufficient literature on many types of mining now exists to allow a compilation of data to identify similarities and highlight site-specific differences. This, in turn, provides an opportunity to understand mining and milling operations on a large scale in order to (1) remediate closed minesites, (2) guide environmental studies at existing operations, and (3) design improved minesites for the future. The compilation of data and the conceptual chemical models of mining are the primary objectives of this book.

1.2 Organization of This Book

The next chapter, Chapter 2, describes the various minesite components whose physical and chemical characteristics affect the chemistry of their drainages. Chapter 2 also introduces the terminology used in this book. While most technical words are used consistently around the world, other terms vary widely in their meaning and usage. Therefore, clearer communication requires well-defined terminology. For example, the word *mine* is used here as a specific component (open pit or underground working), whereas *minesite* refers here to a set of components. A Glossary is provided in Appendix A to standardize technical meanings in this book.

Chapter 3 provides a brief explanation of how water drains through and from minesite components. This drainage occurs as surface and ground waters. Consequently, Chapter 3 provides the physical framework of water movement, onto which chemistry is superimposed.

The remaining chapters are dedicated to the chemistry of drainage waters. Chapter 4 describes drainage chemistry through in-field case studies of various minesite components. Chapter 5 then explains and illustrates methods for predicting drainage chemistry, and thus provides important theoretical background of a practical nature.

Chapter 6 discusses the geochemical aspects of various methods for controlling the chemistry of drainage waters. The appendices provide supporting information for these chapters.

1.3 Questions

1-1. Many metals and minerals are obtained by mining. How many objects have you encountered in your life that were not derived from, or affected by, mining? (Keep in mind that even a smooth piece of wood may have been cut or trimmed by a metallic instrument fashioned from mined metal.) Over the next 24 hours, note how few non-mining-related objects you

encounter.

- 1-2. What would be the effect on our standard of living if various types of mining, like gold, copper, and potash mining, were halted?
- 1-3. What percentage of your country's economic production is derived from mining or mineral processing?
- 1-4. In your community and country, do most people recognize the contribution that mining makes to the economy and their standard of living?
- 1-5. How much would you limit mining to protect the environment near your home?
